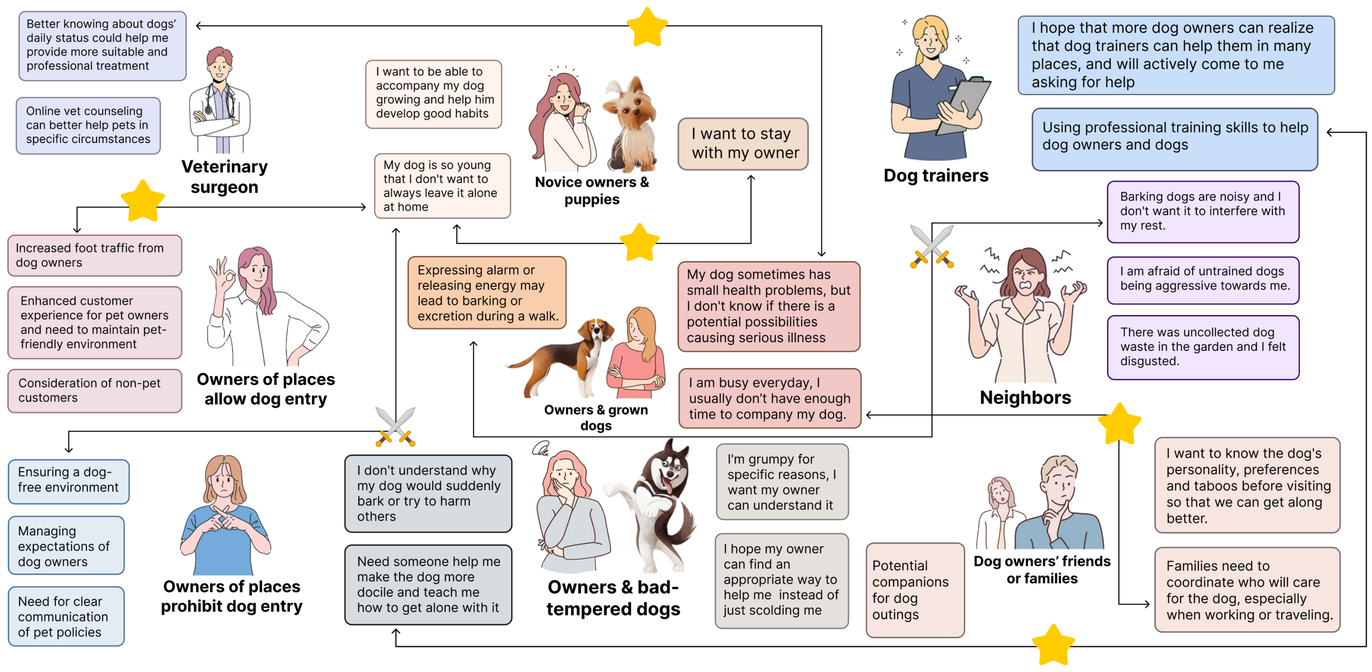
DOGO

Domain

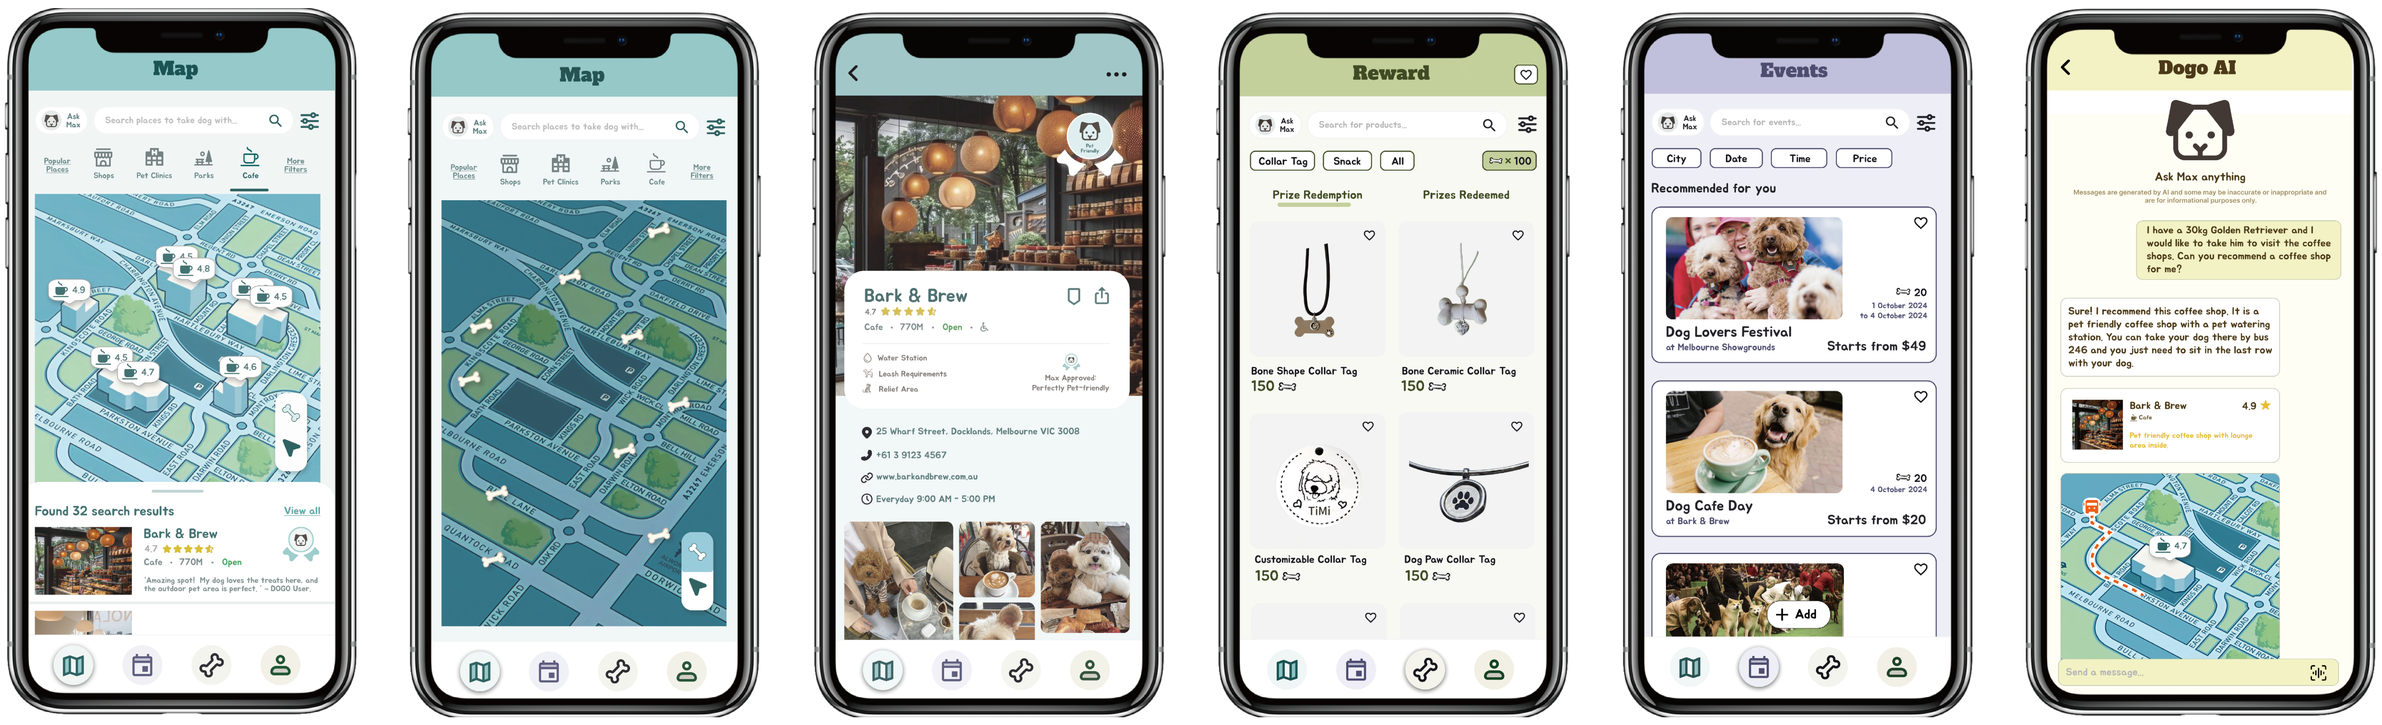
As urbanization accelerates, green spaces suitable for dog activities and pet-friendly venues are becoming increasingly scattered. This forces dog owners to leave their furry companions at home when going out, limiting their interaction with their pets. Additionally, the lack of shared activity spaces weakens the connection between pet owners and the community, hindering the formation of pet-friendly communities.

Stakeholders



Prototype

Dogo, as a comprehensive guide for dog-friendly locations, bridges the information gap between pet owners and their surroundings. Dogo has three core features: 1.Quickly search for dog-friendly places using conventional filters and AI inquiries. 2.Collect virtual bones while on the go and redeem them for tangible rewards. 3.Participate in events published by local businesses and interact with other pet owners.



3D Building Display | Bone Collection | Venue Information | Prize Redemption | Events List | AI Chat

Experience Journey

Evaluation

We invited six users to participate in usability testing for Dogo. Participants were asked to experience the application and evaluate its interface design and ease of use. The testing included the following tasks:

- Using conventional filters and the Max AI feature to search for information.
- Activating the virtual bone collection.
- Redeeming physical rewards.
- Signing up for events.

Findings

Positive Feedback:

- The filtering options are clear, and the overall operation is smooth.
- The virtual collvection and physical rewards mechanism is innovative.

Areas for Improvement:

- The visibility of certain bvvuttons is insufficient; it is recommended to increase contrast and size to enhance visibility.
- There is a lack of clear instructions on how to collect bones and the redemption process.
- Adding clearer store rating badges would help users quickly assess.
